                                                                            erythematosus haemolytic andemia thrombocytopaenia insphylaxis allergy, colorectal or breast cancer, lymphoma, leukaemia infection by allergy, colorectal or breast cancer, lymphoma, leukaemia infection by intracellular pathogens etc). The antagonists are also useful as munomodulators and inhibitors of viral (e.g. human immune deficiency or dengue viruses) entry into cells. The proteins may also be used to screen for specific binding agents, i.e. (ant)agonists, for raising antibodies (Ab), and for identification of particular cells or tissues. The Ab can be used therapeutically as antagonists; as assay reagents for diagnostic determination of the levels of expression of the proteins and for affinity purification of the proteins. The DNA and its fragments are useful as hybridisation (chromosome mapping) and diagnostically to measure ever the protein and diagnostically to measure
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid encoding Fc receptor-like polypeptides or their fragments - and related vectors, transformed cells and antibodies, useful for treating and diagnosing diseases of the haematopoletic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gentz RL,

By analogy with the structure and function of known MHIC Class I receptor molecules, LIRs having ITMS are inhibitory receptors mediating negative signalling, whilst those lacking ITMS are activatory receptors. Failure of a receptor that mediates negative signalling could result in autoimmune diaesases, whilst failure of a receptor mediating activatory signalling could result in suppressed immune function. They are also useful to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (LIR) polypeptide LIR-pbm2. This sequence can be administered therapoutically to treat disorders associated with insufficient/defective amounts of LIR polypeptide. LIR-P302 and certain other LIR family members contain cytoplasmic immunoreceptor tyrosine based inhibitory motifs

                                               Host cells transformed with a vector which are capable of expressing a leukocyte immunoglobulin like receptor (LIR), can be used to produce the LIR polypeptide. LIR coding sequences may be used in the gene therapy of disorders mediated directly or indirectly by defective or insufficient amounts of any of the LIR polypeptides. The LIR polypeptides can be used to treat outcommune diseases and disease states with suppressed immune function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     380

                                                                                                                                                                                                                                                   Host cells transformed with a vector which are capable of expressing a leukocyte immunoglobulin like receptor (LIR), can be used to produce the LIR polypeptide. LIR coding sequences may be used in the gene therapy of discorders mediated directly or indirectly by defectively not discorders mediated directly or polypeptides. The LIR polypeptides can be used longer autoLimnune diseases and disease states with suppressed immune function.

designated KTEQ3. The genes are found in activated monocytes. The specification also describes other proteins encoded by activated monocytes, which are designated PDF03 and YEQ1 The genes function in controlling development, differentiation, and/or physiology of the mammal in minume system. The products can be used for treating encountries, degeneration or arrophy. They can be used for treating e.g. cancerstion, degeneration, degenerative conditions, factly versus bost autoimment responses, transplantation rejection, graft versus bost disease, or inflammatory conditions. The products can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated activated monocyte cell gene(s) - used to develop
products for treating e.g. cancer, degenerative conditions,
autoimmune responses, transplant rejection or inflammatory

                                                                                                                                                                                                                                                                                                                                                                                             This sequence encodes a novel leukocyte immunoglobulin-like receptor (LIR) polypeptide LIR-PSG2 This sequence can be administered wherepeatically to treat disorders associated with insufficient/defective mounts of LIR polypeptide. LIR-PSG2 and certain other LIR family members contain cytoplasmic immunoreceptor tytosine-based inhibitory motifs (ITIMS), whilst other LIR family members lack ITIMS. By analogy with the structure and function of known MRC Class I receptor molecules, LIRs having ITIMS are althibitory receptors mediating negative signalling whilst those lacking ITIMS are activatory receptors. Failure of a receptor that mediates negative signalling could result in suppressed immune timesters. The structure of a receptor mediating activatory signalling could result in suppressed immune function, They are also useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cos

LIR coding sequences may be used in the gene therapy of disorders mediated directly or the LIR polypeptides can be used to treat autoimmune of any of the LIR polypeptides. The LIR polypeptides can be used to treat autoimmune diseases and disease stakes with suppressed immune function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     310

XX FC RECEPTOT-like proton in the proton in th dengue viruses) entry into cells. The proteins may also be used to screen for specific binding agents, i.e. (ant)agonists, for raising antibodies (Ab), and for identification of particular cells or tissues. The Ab can be used therapeutically as antagonists; as assay reagents for diagnostic determination of the levels of expression of the proteins and for affinity purification of the proteins. The DAA and its fragments are useful as hybridisation probes or primers for isolating related genes, in situ hybridisation (chromosome mapping) and diagnostically to measure This sequence encodes the Fc receptor-like III protein (FcR-III) of the invention. Cells containing the DNA are used to express the recombinant protein, and to screen for specific (ant)agonists the proteins are used to induce phagocytosis, and their (ant)agonists are used to treat immune complex related diseases (e.g., rheumatoid arthritis, systemic lupus allergy, colorectal or breast cancer, lymphona, leukemia, infection by intracellular pathogens etc). The antagonists are also useful as immunomodulators and inhibitors of viral (e.g. human immune deficiency or erythematosus, haemolytic anaemia, thrombocytopaenia, anaphylaxis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (LIR) polypeptide LIR-phm17. This sequence can be administered therapeutically to treat disorders associated with insufficient/defective amounts of LIR polypeptide. LIR-F302 and certain other LIR family members contain cytoplasmic immunoreceptor typosine-based inhibitory mobilis (ITIMS), whilst other LIR family members lack ITIMS. By analogy with the structure and function of known MHC Class I receptor modecules, LIRs having ITIMS are inhibitory receptors mediating negative signalling, whilst those lacking ITIMS are activatory receptors. Failure of a receptor that mediates negative signalling could result in suppressed immune function. They are also useful to produce probes for detecting LIR nucleic acids or isolating LIR DNA from the reservice.

                                                                                               Percent Similarity:
                                                                                                                                                                                                      Host cells transformed with a vector which are capable of expressing a leukocyte immunoglobulin like receptor (LTR), can be used to produce the LTR polypeptide. LTR coding sequences may be used in the gene therapy of discorders mediated directly or indirectly by defective or insufficient amounts of any of the LTR polypeptides can be used to treat autolimnune disease and disease states with suppressed immune function.
                                                                                                                                                                                                                                                                                                                                                             Loukocyte immunoglobulin-like receptor (LIR) nucleic acids, useful for treating autoimmune diseases and disease states with suppressed immune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   having TTMs are inhibitory receptors mediating negative signalling, whilst those lacking ITMs are activatory receptors. Failure of a receptor that mediates negative signalling could result in autoimmune diseases, whilst failure of a receptor mediating activatory signalling could result in suppressed immune function. They are also useful to produce probes for detecting LIR nucleic acids or isolating LIR DNA from the country of the country
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              amounts of LIR polypeptide. LIR-P3G2 and certain other LIR family members contain cytoplasmic immunoreceptor tyrosine-based inhibitory motifs (ITIMS), whilst other LIR family members lack ITIMS. By analogy with the structure and function of known MHC Class I receptor molecules, LIRs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence encodes a novel leukocyte immunoglobulin-like receptor (LIR) polypeptide LIR-pma6-2. This sequence can be administered therapeutically to treat disorders associated with insufficient/defective
                                                                                                                                                                                                                                                                                                                                                                                         459
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     409
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         271
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      221 CCGGACCCACGTGCAGGCAGGGACCCTCCCCAAGCCCCACACTCTGGGCTG

```
host cells transformed with a vector which are capable of expressing a leukocyte immunoglobulin like receptor (LIR), can be used to produce the LIR polypeptide. LIR coding sequences may be used in the gene therapy of disorders mediated directly or indirectly by defective or insufficient amounts of any of the LIR polypeptides can be used to treat autoimmune polypeptides. The LIR polypeptides can be used to treat autoimmune

(LIR) polypoptide LIR phm36-4. This sequence can be administered therapeutically to treat disorders associated with insufficient/defective amounts of LIR polypoptide. LIR PBG2 and cortain other LIR family members contain cytoplasmic immunoreceptor tyrosine-based inhibitory motifs (TTMS), whilst other LIR family members lack (TTMS, By nanlogy with the structure and function of known MRC class: receptor molecules LIRS having TTMS and function of known MRC class: receptors molecules LIRS whilst those acking LTMS are activatory receptors. Failure of signalling, whilst those acking LTMS are activatory receptors. Failure of activatory signalling could result in autoimmune diseases, whilst failure of a receptor mediating activatory signalling could result in suppressed immune function. They are also useful to

This sequence encodes a novel leukocyte immunoglobulin-like receptor

LIR coding sequences may be used in the gene therapy of disorders mediated directly or indirectly by defective or insufficient amounts of any of the LIR polypeptides can be used to treat autoimmune diseases and disease states with suppressed immune function.

                                                                                                                                                                                                                                                                                                                                                                                                                                                having ITIMs are inhibitory receptors mediating negative signalling, whilst those lacking ITIMs are activatory receptors. Failure of a receptor that mediates negative signalling could result in autoimmune diseases, whilst failure of a receptor mediating activatory signalling could result in suppressed immune function. They are also useful to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        24-APR-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              insat cells transformed with a vector which are capable of expressing a leukocyte immunoglobulin like receptor (LIR), can be used to produce the LIR polypoptide. LIR coding sequences may be used in the gene therapy of discordurs mediated directly or the LIR polypoptides can be used to treat autoimmune of the LIR polypoptides. The LIR polypoptides can be used to treat autoimmune diseases and disease states with suppressed immune function.

These were derived from expressed sequence tags (EST8) from the organism of interest. They can be used in dispositics, forensics, gene mapping, identification of mutations, to assess prodiversity and for nutritional purposes. The present sequence is a CDNA prodiversity and for nutritional purposes.

antidiabetic, hypotensive; dermatological; inmunosuppressive; antidiabetic, hypotensive; dermatological; antifungal; antidrematic; antithyroid; and antibacerial; antiviral; antifungal; antidrematic; antithyroid; and antianaemic. The sequences can be used for determinif the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder, nucleic acids can be used to express ORFX proteins in gene therapy wereness. The proteins and nucleic acids may be used to treat cancers,
                                                                                                                                                                                                                  AC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 316. The ORFX sequences have activities such as cytostatic; hepacotropic; vulnerary; antipacriatic; antiparkinsoniam; noctropic; neuroprotective; osteopathic; antipacriatis; articorvulsant; antiarthritic; immunospressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel nucleic acids and peptides derived from open reading useful for treating e.g. cancers, proliferative disorders,

The present invention also describes: (1) a fusion polypeptide comprising a human gp49 component and FceR1 or a detectable marker; (2) a recombinant nucleic acid encoding human gp49 or a human gp49-FccR1 fusion as above; (3) a cell or vector comprising the recombinant nucleic acid as in (2), and (4) an antibody which selectively binds to gp49. Mammalian gp49 or its related object and selectively binds to gp49. Mammalian gp49 or capacially a mast cell-related disease.

e.g. for treating autoimmune diseases with suppressed immune function Leukocyte immunoglobulin-like receptor, LIR, polypeptides - useful, e.g. for treating autoimmune diseases or disease states associated

Example 9; Page 62-64; 112pp; English.

receptor that mediates negative signalling could result in autoimmune diseases, whilst failure of a receptor mediating activatory signalling could result in suppressed immune function. They are also useful to (LIR) polypeptide LIR-pbm25. This sequence can be administered therapeutically to treat disorders associated with insufficient/defective amounts of LIR polypeptide. LIR-P3C2 and cortain other LIR family members contain cytoplasmic immunoreceptor tyrosine-based inhibitory motifs (TTMS), whilst other LIR family members lack TTMS. By analogy with the structure and function of known MHC Class I receptor molecules, LIRs having TTMs are inhibitory receptors mediating negative signalling, whilst those lacking TTMs are activatory receptors. Failure of a produce probes for detecting LIR nucleic acids This sequence encodes a novel leukocyte immunoglobulin-like receptor or isolating LIR DNA from

The products can be used for treating abnormal proliferation, regeneration, degeneration or atrophy. They can be used for treating e.g. cancerous conditions, degenerative conditions of the conditions transplantation rejection, graft versus boot disease, or inflammatory conditions. The products can also be used for detection, disgnossis and drug screening.

```

The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.

The present invention relates to single exon nucleic acid probes (SENP).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Percent Similarity:
                                    The present sequence represents a base sequence from the human chromosome 21, used in an example of the present invention. The present invention describes a method for detecting and isolating an active gene in which an uncommon restriction enzyme its prepared. The method comprises: (a) physically mapping a specified region of a chromosome and the base sequence upstream and downstream of the restriction enzyme site within the map, and (b) detecting and
                                                                                                                                                                                     Detection and isolation of active gene - by physically mapping specific region on chromosome and detecting and isolating gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               147

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mRNAs encoding secreted proteins to ORF has yet been conclusively identified within the present sequence. The 5 ISSTs were prepared from lotal human RNAs or polyx+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (dTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain (uil length CDNAs and genomic DNAs. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain (uil length CDNAs and genomic DNAs. 5' ESTs are decrived from mRNAs with intact 5' ends and can therefore be used to obtain upstream regulatory sequences and to design excrete the vectors.

                                                                                                                                                                                                                                                                                                    This sequence represents a nucleic acid molecule which encodes a scerered human protein. The gene number is given in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g., AAX84924) for increasing the stability of the fused protein as compared to the human protein only the father than the fused protein as compared to the human protein only the cald sequences. AAX84932-X85057, amino acid sequences AAX84937-X77933) which are useful for reverenting treating or amplibrating modical conditions each be diagnosed by determining the amount of the new polymore to be specific uses are described for each of the 125 polymore.

The proteins can be combined with tyrosine phosphatase SHP-1, SHP-2 or inositol-5-phosphatase SHIP by phosphating tyrosine. The present invention also describes an immunoreceptor comprising one the above proteins, and DMA coding the above proteins. The new proteins can be used as an immunomodulatory agent. The present sequence encodes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         activity. The invention also includes antibodies specific for the protein or polynucleotide sequences. The lung cancer associated polynucleotide sequences may be used for detection of lung cancer, chromosome identification, as chromosome markers, and for numerous diagnostic or research purposes. The proteins may be used to treat disorders such as neural, immune, muscular, reproductive, and for the proteins may be used to treat disorders such as neural, immune, muscular, reproductive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gastrointostinal, pulmonary, cardiovascular, renal, and proiderstive disorders. The proteins may also be used in the treatment of vounds infectious diseases, polynucleotide sequences ANF845 - ANF8483 and peptide ANF8494 are used in the course of the invention for the identification and characterisation of the polynucleotide and protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        733 ATGGCTGTGAAATTTCTCTGGTGGGGGATGACCTGGATCCCGAGCGGGAA
